# The six Apple Intelligence features that change classroom work.

*iPad-first, privacy-aware, takes 10 minutes to learn.*

Apple Intelligence runs mostly on your device — a genuine GDPR advantage when your work involves sensitive content. These six features give you the strongest daily return. Details on what leaves the device are in Part 3 of the full guide.

## Six features, one pocket

### 1
### Writing Tools

Rewrite, proofread, summarise. Grading comments, parent emails, lesson plans. Most on-device.

### 2
### Siri 2.0

Context-aware scheduling, cross-app retrieval. On-device for nearly everything.

### 3
### Mail categorisation

Primary / Transactions / Updates / Promotions. Find the email parents actually ask about.

### 4
### Notification summaries

50 overnight alerts become one readable line. On-device, entirely.

### 5
### Notes + Image Wand

Sketch or describe → polished illustration for worksheets and whiteboards.

### 6
### Visual Intelligence

Point the camera at text or objects for translation, summaries, context.

# Try it: 5 practical tasks.

*Ten minutes, five moves, one less thing on your plate tonight.*

1. **Rewrite a parent email in three tones**
   Writing Tools offers Friendly / Professional / Concise. Pick the one that fits, send.

2. **Summarise a 5-page curriculum PDF**
   Drop the PDF into Notes, ask Writing Tools for a summary. Private Cloud Compute handles the long input.

3. **Ask Siri for Thursday's schedule**
   "Open Notes for Thursday's planning" and "Email the Year 9 parents about the trip" in one breath.

4. **Triage a flooded inbox**
   Mail Primary shows the three parent questions that actually need answers; the rest is grouped quietly below.

5. **Sketch a diagram in Notes**
   Rough circles and labels become a whiteboard-ready illustration via Image Wand.

**• WATCH OUT · AGE-GATES AND DATA**

Some features are 18+; verify your national rules for student-facing use. De-identify documents before Apple Intelligence processes them. Disable ChatGPT integration on school devices by default — it sends text to OpenAI and opens a different privacy conversation entirely.
