

ONE PHOTO, ONE WORD: /GHOSTED

FOR TEACHERS AND SCHOOL LEADERS

Eight categories, one word each

50 visual codes for ChatGPT

Upload one photo, type one word, get a teaching visual.

VOL. 1

START HERE

What is a visual code?

A visual code is a one-word, slash-prefixed prompt — like /cutaway or /anatomy — that you send to ChatGPT together with an uploaded photo. The image model reads the word as an instruction and returns a transformed version of the same picture: a cutaway view, an X-ray, a labelled anatomy diagram, a technical blueprint.

They are not official ChatGPT commands. Nobody at OpenAI decided that /cutaway should mean anything. These words work because the image model has seen thousands of pictures that genuinely are cutaways, X-rays and blueprints — so the word already carries a visual meaning it can act on. That also explains the limit: a word the model has no picture of will do nothing at all.

This collection holds 50 codes with clear classroom value, sorted into eight categories. Every code is shown twice — the original photo on the left, what came back on the right. Both images in each pair were made from the same source picture, so what you see is the difference the single word made.

See inside 9 codes 4

Zoom to science scales 4 codes 5

How things work 7 codes 6

Processes and time 6 codes 7

Compare and decide 4 codes 8

Technical drawing and math 9 codes 9

Classroom-ready annotations 6 codes 11

Body, life and environment 5 codes 12

THE METHOD

Make your own in 30 seconds

01

Upload a photo

Any photo works: an object, an animal, a place, a screenshot — or a picture you have generated yourself.

02

Type one code

Send just the codeword and nothing else — for example /cutaway. That single word is the whole prompt.

03

Ask for labels

Want text in the image? Add *"with clear labels in English"* — or in any language your class works in.

04

Keep it comparable

Add *"keep the same subject, pose, scale and framing"*. Without it the model quietly zooms or re-crops, and the two images no longer line up.

Most codes work on their own. A few cannot: "compare two versions" and "show the change" are impossible to follow unless the model knows *compare with what* or *change into what*. Those codes carry an ADD line in the pages that follow, with the exact words to append. Ten of the fifty need one.

Use the same trick whenever a result disappoints. One word is usually enough, but if the word leaves too much room for interpretation the model will pick the shallowest reading — often just labelling the surface instead of transforming the picture. When that happens, add the context you had in mind: not /anatomy but *"/anatomy — show the internal organs beneath the skin"*. You are not breaking the method; you are telling it which of several possible answers you were after.

Level up: combine codes

The codes are plain prompts, so they stack. Try sending two or more in the same message: /cutaway /annotatedphoto gives you an opened-up view with labels, /anatomy /educationalposter turns an animal photo into a labelled classroom poster. Two or three compatible codes usually beats one — experiment.

One thing worth knowing

The subject decides more than the prompt does. /layers does nothing to a house or a meadow, but gives clean soil horizons on a lifted piece of turf. If a code disappoints, try it on a different photo before you give up on it.

9 CODES

See inside

Open up the subject and show what the eye cannot see — the classic teaching move.

/cutaway

Opens the outer shell so students can look straight into the machine, building or vehicle.

BEFORE

/CUTAWAY

/xray

Turns the photo into an X-ray view that reveals what hides under the surface.

BEFORE

/XRAY

/crosssection

Slices the subject cleanly through the middle, like a diagram in a textbook.

BEFORE

/CROSSSECTION

/explodedview

Pulls the parts apart in mid-air so every component and its place become visible.

BEFORE

/EXPLODEDVIEW

/layers

Separates the subject into stacked layers — ideal for anything built up in strata.

BEFORE

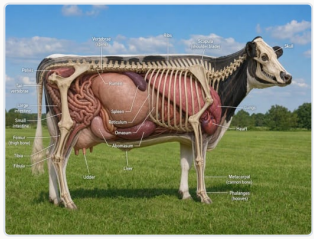

/LAYERS

/anatomy

Labels the body systems and structures of an animal or person, straight on the photo.

BEFORE

/ANATOMY

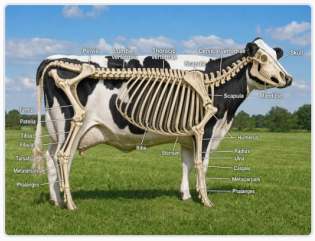

ADD show the internal organs and skeleton beneath the skin, not just external body parts

/skeletonview

Shows the bones or supporting framework beneath the subject.

BEFORE

/SKELETONVIEW

/hiddenparts

Reveals the components concealed behind a smooth, closed surface.

BEFORE

/HIDDENPARTS

ADD make the outer steel shell transparent so the concealed inner chamber, the double wall and the vacuum gap between them become visible

/ghosted

Lets the hidden structure show through as faint outlines, leaving the outside intact.

BEFORE

/GHOSTED

ADD make the walls and roof semi-transparent so the rooms, floors and timber frame inside show through as faint outlines

4 CODES

Zoom to science scales

Bridge the visible world and the scales students can only imagine.

/cellularview

Zooms from the photo down to cell level — a bridge from the visible to the microscopic.

BEFORE

/CELLULARVIEW

/molecularview

Goes one step further and shows the subject at molecular scale.

BEFORE

/MOLECULARVIEW

/thermalview

Repaints the scene the way a heat camera sees it — great for energy and physics lessons.

BEFORE

/THERMALVIEW

/magneticfield

Draws the invisible magnetic field lines around the subject.

BEFORE

/MAGNETICFIELD

7 CODES

How things work

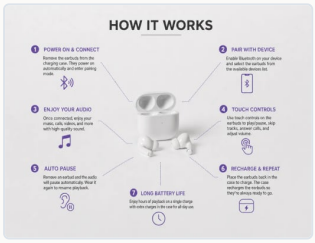

Turn any photo into a functional explanation of what is really going on.

/howitworks

The all-round explainer: turns the photo into a visual walkthrough of how the thing works.

BEFORE

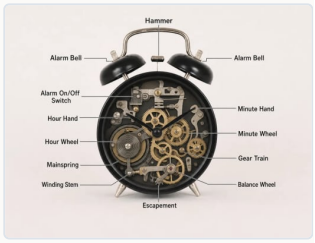

/HOWITWORKS

/mechanism

Zooms in on the gears, springs and levers that make the subject work.

BEFORE

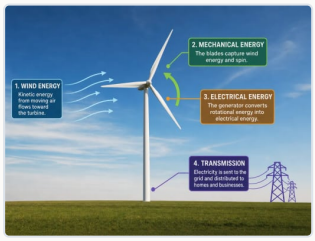

/MECHANISM

/energyflow

Traces how power moves through the subject, from source to output.

BEFORE

/ENERGYFLOW

/flowdiagram

Shows how air, water, blood or data streams through the subject.

BEFORE

/FLOWDIAGRAM

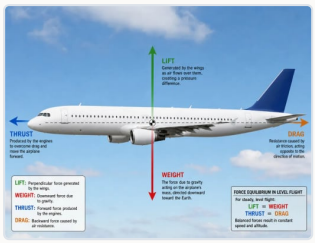

ADD show how blood flows through the body

/forceanalysis

Visualises the forces at play — pressure, weight, lift, stress.

BEFORE

/FORCEANALYSIS

/motionpath

Draws the path a moving part, or the whole subject, follows.

BEFORE

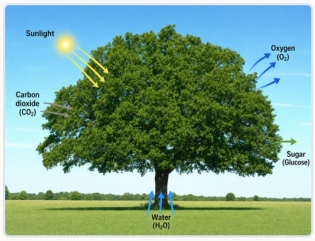

/MOTIONPATH

/inputoutput

Shows what enters the system and what comes out the other end.

BEFORE

/INPUTOUTPUT

> ADD show what goes into the tree and what comes out during photosynthesis

6 CODES

Processes and time

Stretch a single moment into a sequence, a history or a whole life.

/lifecycle

Expands the photo into a full life cycle, from beginning to end.

BEFORE

/LIFECYCLE

/timeline

Places the subject on a timeline and shows how it developed.

BEFORE

/TIMELINE

/timelapse

Compresses a slow process into a single image.

BEFORE

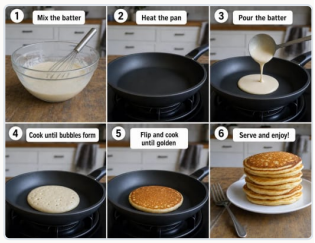

/TIMELAPSE

/stepsequence

Breaks a task into numbered frames, step by step.

BEFORE

/STEPSEQUENCE

/beforeafter

Shows the change — what it looked like, and what it became.

BEFORE

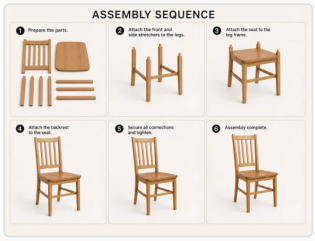

/BEFOREAFTER

/assemblysequence

Shows how the separate parts go together, in numbered stages.

BEFORE

/ASSEMBLYSEQUENCE

4 CODES

Compare and decide

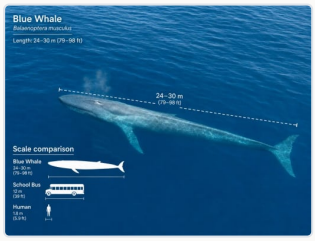

Put things side by side and let students reason about the difference.

/scalecomparison

Puts the subject next to a hand or a person so its real size lands.

BEFORE

/SCALECOMPARISON

/sidebyside

Lines up two versions in matching views so differences jump out.

BEFORE

/SIDEBYSIDE

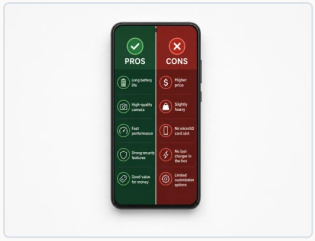

ADD compare it with a mobile phone from 2005 and label this one 2026

/proscons

Turns the subject into a clear advantages-and-drawbacks visual.

BEFORE

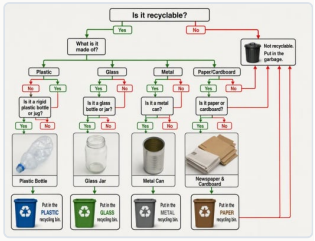

/PROSCONS

/decisiontree

Maps the choices: what to do next at every branch.

BEFORE

/DECISIONTREE

ADD draw a branching yes/no flowchart for sorting each item into the right recycling bin

9 CODES

Technical drawing and math

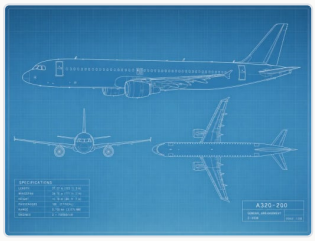

Give any object the engineer's treatment — lines, grids, measurements and perspective.

/blueprint

Redraws the photo as a classic technical blueprint.

BEFORE

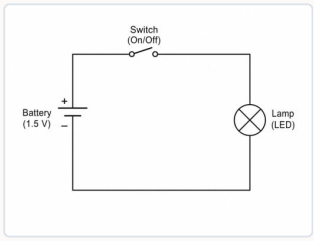

/BLUEPRINT

/schematic

Reduces the subject to a clean functional diagram.

BEFORE

/SCHEMATIC

ADD redraw it as a technical circuit diagram with standard symbols for the battery, switch and lamp

/technicaldrawing

Shows accurate front, side and top views, like an engineer's sheet.

BEFORE

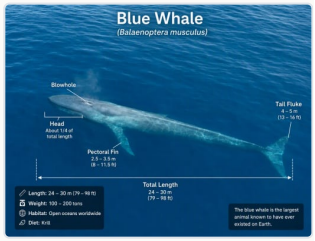

/TECHNICALDRAWING

/dimensionview

Adds measurements around the subject — instant math material.

BEFORE

/DIMENSIONVIEW

/scalegrid

Lays a grid over the subject for talking about size and proportion.

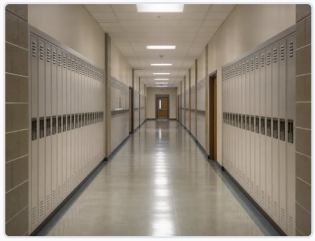

BEFORE

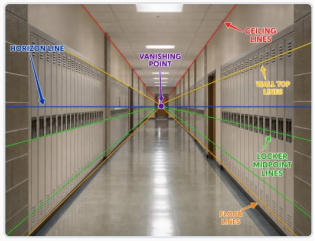

/SCALEGRID

/vanishingpoint

Exposes the perspective lines — a gift for art class.

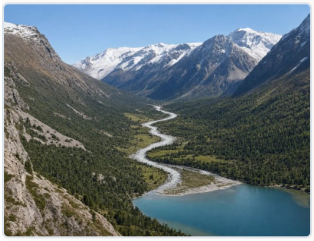

BEFORE

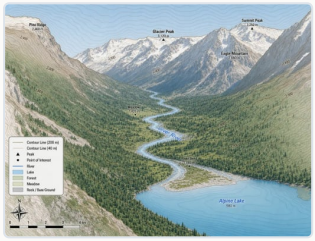

/VANISHINGPOINT

/contourmap

Translates height and depth into contour lines, like a map.

BEFORE

/CONTOURMAP

/cadview

Presents the subject as a CAD model, the way an engineer would draw it.

BEFORE

/CADVIEW

/materialmap

Identifies which material each part is made of.

BEFORE

/MATERIALMAP

> ADD colour-code every region by the material it is made of — steel, aluminium, rubber, leather, plastic — with a colour key, not by part name

6 CODES

Classroom-ready annotations

Keep the photo, add the teaching layer on top.

/annotatedphoto

Keeps the photo intact and adds clean labels right on it.

BEFORE

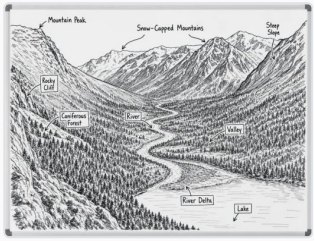

/ANNOTATEDPHOTO

/whiteboard

Redraws the image as a hand-drawn whiteboard explanation.

BEFORE

/WHITEBOARD

/educationalposter

Turns the photo into a poster with facts and labels.

BEFORE

/EDUCATIONALPOSTER

/infographic

Converts the subject into a data-rich infographic.

BEFORE

/INFOGRAPHIC

/instructioncard

Condenses the task into a compact visual instruction card.

BEFORE

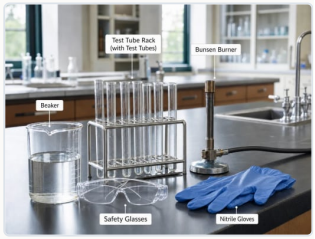

/INSTRUCTIONCARD

/protectivegear

Shows the safety equipment the situation calls for.

BEFORE

/PROTECTIVEGEAR

5 CODES

Body, life and environment

Turn a photo of a body, an animal or a place into biology teaching material.

/musclemap

Labels the major muscles and shows where they sit.

BEFORE

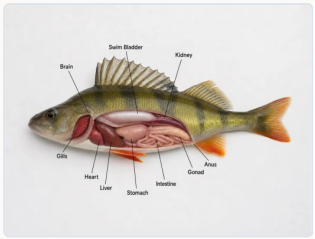

/MUSCLEMAP

/organmap

Labels the internal organs — the dissection diagram without the dissection.

BEFORE

/ORGANMAP

/rangeofmotion

Shows how far a joint can move, and in which directions.

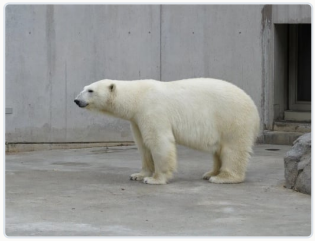

BEFORE

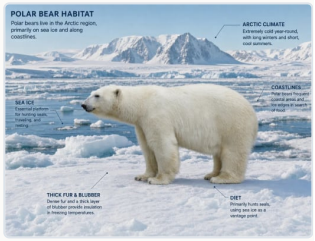

/RANGEOFMOTION

/habitatview

Moves the animal into the environment it actually lives in.

BEFORE

/HABITATVIEW

/interactionmap

Maps how the species in a place depend on one another.

BEFORE

/INTERACTIONMAP

ADD draw the food web showing which animals and plants in this pond depend on each other, with arrows for who eats whom

On the codes themselves

The codewords are common vocabulary, and lists of them circulate widely online — this collection was assembled after reading one such list. Everything else here is original: the selection for classroom value, the categories, every description, and every image.

How the images were made

Each pair started as one generated photograph. The second image was produced by sending that photo back to the image model with the codeword and an instruction to keep the same subject, pose, scale and framing. Nothing was retouched by hand, and no result was cherry-picked from several attempts without saying so — where a code needed an added sentence to work, that sentence is printed on the page.

A note on accuracy

These images are teaching aids, not references. An AI-generated anatomy diagram can place a bone wrongly or invent a label. Check anything students will be assessed on, exactly as you would check any other classroom resource.

KEEP GOING

The right tool at the right time.

This collection is one piece of a larger idea: schools usually do not need more AI tools. They need the judgment to choose the right tool at the right moment — and the skill to use it well when they do.
