

TO READ

TO PRACTISE

SAME TOPIC, TWO CODES: /CHEATSHEET TO READ, /QUIZMATE TO PRACTISE

FOR TEACHERS AND SCHOOL LEADERS

27 codes, tested on three subjects

Visual codes for studying

Type a code and a topic, get a study poster or a worksheet.

CODES
27

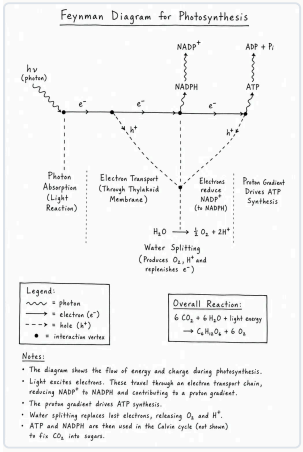

START HERE

Not commands — an educated guess

Type a code and a topic into an AI chatbot and you get a study poster or a worksheet in seconds. We tested 27 codes from the lists circulating on social media, on three subjects: photosynthesis, the French Revolution and the Pythagorean theorem. The codes that make students practise come first — because a poster that is only read does the least for learning.

These codes are not official commands built into the chatbot. Nobody has programmed a /cheatsheet button. The model has simply seen so many cheat sheets, mind maps and quizzes in the data it was trained on that one word is enough for it to understand what you are after.

That is also the catch. What you get is an average interpretation of everything the model has seen. Often the average is exactly right. Sometimes it is not, and then you need to add your own instructions to get the result you want. That is why every practise code in this guide comes with one extra sentence.

/feynman alone. A Feynman diagram from particle physics — notation that does not fit photosynthesis.

/feynman + one sentence. The worksheet the code was meant for.

Where can you make them?

In any chatbot that generates images, such as ChatGPT or Gemini. Check the age limit before you plan a lesson: ChatGPT is 13+, with parental consent below 18. Gemini is 13+ with a personal or school account — a school account only once the school's administrator has turned it on — and Google's paid AI plans are 18+ in the EEA, Switzerland and the UK. In most classrooms that means the teacher makes the sheet and prints or shares it — the student needs no account at all. You are responsible for following your country's rules and your school's guidelines.

All images in this guide were made with GPT Image 2, portrait, high quality. The prompt went straight to the image model; in a chatbot the chat model reads it first, so your result can differ — sometimes for the better.

THE METHOD

Make your own

01

Code and topic

Type the code, then the topic: /cheatsheet photosynthesis. Better still, paste your own notes or the textbook page after it.

02

Ask for an image

End with Make it an image. Without it, most chatbots answer in text.

03

Add the sentence

Practise codes need one extra sentence at the end of the prompt. Without it, the model often prints the answers right on the sheet — and there is nothing left to practise. The sentence moves them to a key at the bottom. It is printed on each card's ADD line.

04

Check before you share

Read every fact and work through the answer key yourself. The key was the weakest part of almost every worksheet we tested.

Three ways to use them

Print and hand out

The worksheets in Part 1: students fill them in, fold them or cut them up.

Put it on the wall

Cheat sheets, timelines and mind maps as support for the whole unit.

Share it digitally

In your learning platform, or on the student's phone before a test.

Each card shows which uses suit that code. The images are about 1024 × 1536 pixels: sharp on A4, soft on an A3 poster — upscale before you print large. And check the facts first: a mistake on the wall stays up for months.

Why the practise codes come first

A review of ten common study techniques found that testing yourself and spreading practice over time give the largest gains (Dunlosky et al., 2013). A later meta-analysis of 242 studies put numbers on it: d = 0.85 for spaced practice, d = 0.74 for practice testing, and d = 0.44 for both summarising and highlighting (Donoghue & Hattie, 2021). All ten techniques help; summarising and highlighting help least. Most of the studies measured factual knowledge, so the ranking says less about deep understanding.

One thing matters here: when AI writes the summary, the student skips the part that did the helping. That is the trade-off question in practice — what does the student stop doing, and does it matter? A poster is fine. A poster the student tests themselves against is better.

PART 1

Practise

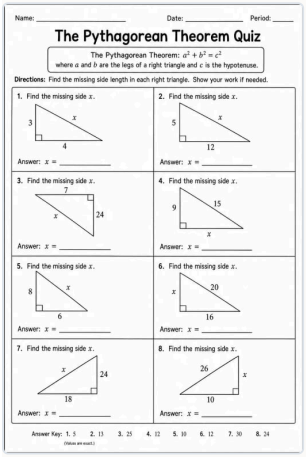

Worksheets the student fills in, folds or answers. Each code needs the sentence on its ADD line, typed after **Make it an image.** Written out in full, a prompt looks like this:

> /quizmate photosynthesis. Make it an image. A quiz sheet with 8 questions and empty answer lines. Answer key in small print at the bottom.

7 CODES

Test yourself

Worksheets that make the student retrieve the answer instead of reading it. The answer key goes at the bottom — cut it off, or check it, before the sheet goes out.

Tested on the Pythagorean theorem

/quizmate

A quiz sheet with empty answer lines. In maths it drew the triangles to solve.

> ADD A quiz sheet with 8 questions and empty answer lines. Answer key in small print at the bottom.

Print

Tested in three subjects — the answer key was right every time.

Tested on the French Revolution

/flashcards

Question on the left, answer on the right. Fold the sheet down the middle and quiz yourself.

> ADD Show the front and back of each card side by side: question on the left, answer on the right, so the sheet can be folded down the middle to hide the answers. The question side shows only the question, with no pictures or hints that give away the answer.

Print Digital

The last sentence matters: without it, the pictures on the question side gave the answers away.

Tested on the French Revolution

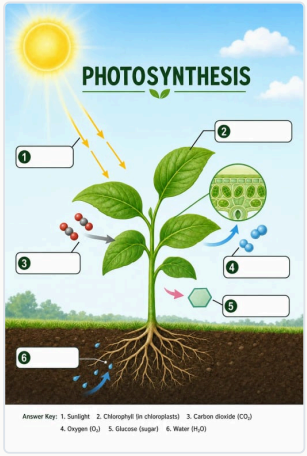

/matchinggame

Terms on one side, shuffled descriptions on the other. The student draws the lines.

> ADD A matching worksheet: terms on the left, shuffled descriptions on the right, no lines drawn. Answer key in small print at the bottom.

Print

All twelve pairs in the key were correct.

Tested on photosynthesis

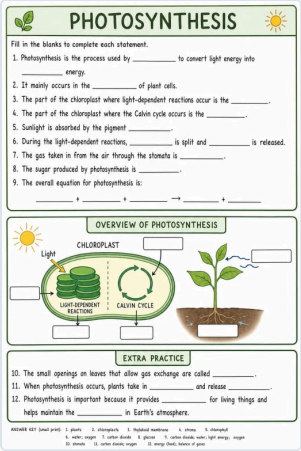

/labeltheimage

A diagram with numbered, empty labels to fill in.

> ADD Numbered empty label boxes with no text in them. Answer key in small print at the bottom.

Print Wall

Clean on photosynthesis. In history the key named a painting from 1830 as a scene from 1789, and in maths the grid squares did not match the triangle.

Tested on photosynthesis

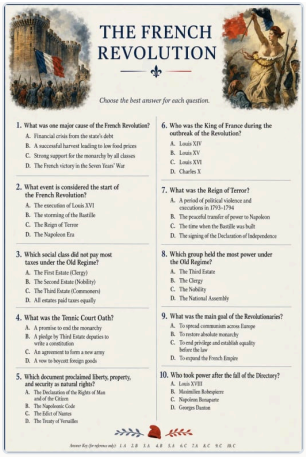

/clozecards

Sentences with gaps to fill in, numbered against a key.

> ADD Leave every blank empty. Answer key in small print at the bottom, with one numbered answer for every blank.

Print · Check the result

Two answers are missing from this key. In maths the model also blanked out the numbers the student needed, so the tasks could not be solved.

Tested on the French Revolution

/mcq

Multiple-choice questions, options A–D, no answer marked.

> ADD Multiple-choice questions with options A–D and no answer marked. Answer key in small print at the bottom.

Print · Digital · Check the result

Work through every question before you trust the key: in maths it was wrong on two of five questions, and one question had two right answers. Note the typo in question 4.

Tested on the French Revolution

/sortinggame

A mixed list and empty columns. The student sorts each item into a category.

> ADD A sorting worksheet: a mixed list of items and empty columns to sort them into. No items placed in the columns. Answer key in small print at the bottom.

Print · Check the result

The categories can be vague. In maths the key sorted false equations such as $2^2 + 3^2 = 4^2$ as worked examples.

2 CODES

Explain it

Sheets with questions and empty space — no key, because the answer is the student's own explanation.

Tested on the French Revolution

/socratic

A chain of questions, each one building on the last.

> ADD Only questions, each one building on the last, with empty space to write an answer. No answers anywhere.

Print · Digital

Without the added sentence, every question came with its answer printed right after it.

Tested on photosynthesis

/feynman

Explain it simply, find the gaps, simplify again — the Feynman technique as a worksheet.

> ADD Use the Feynman learning technique: a worksheet where the student explains the topic in their own words as if to a 10-year-old, with guiding prompts and empty boxes to write in. No answers, and no drawings or hints that give away the content.

Print

The code alone gave a Feynman diagram from particle physics — see the comparison at the top of the page.

BETWEEN THE PARTS

What went wrong when we tested

The answer key is the weak link. The questions were good; the answers were sometimes not. In maths the multiple-choice key was wrong on two of five questions.

Exact things break first. Answer keys, calculations, maps and crosswords failed more often than mind maps and comics.

Plausible facts, wrong facts. In the first round, six of sixteen posters contained a factual error — written as confidently as the rest.

Wrong pictures. Delacroix's *Liberty Leading the People*, painted in 1830, turned up again and again on posters about the revolution of 1789.

The surface reading wins. When a word has two meanings, the model picks the most common one: /feynman gave physics, not a study technique.

Cards marked Spot the error contain a mistake worth showing to the class. Finding it is a lesson in itself.

Tip: anchor the facts in your own material

If you have Gemini and Gemini Notebook (formerly NotebookLM), add your own material as sources in a notebook — the textbook chapter, your slides, your notes. Then open Gemini, add the notebook through the + button in the chat, and use the codes there. The image is built from your sources instead of from the model's general memory, which reduces the risk of factual errors. It does not remove it, so the check in step 04 still applies.

PART 2

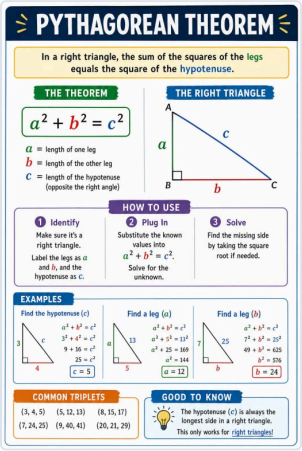

Read

Posters and overviews. The code alone is usually enough — **/cheatsheet photosynthesis. Make it an image.** Every card suggests a way to turn reading into practice.

7 CODES

See the whole topic

One page that holds the whole topic. Good for the wall, for revision — and as the thing to test yourself against.

Tested on the Pythagorean theorem

/cheatsheet

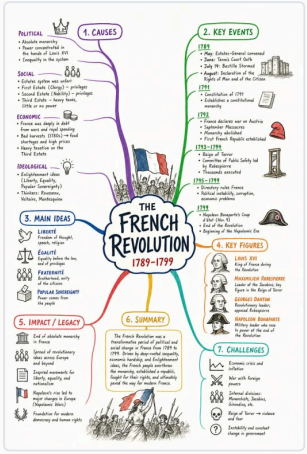

The whole topic on one page: rule, diagram, worked examples, things to remember.

MAKE IT ACTIVE

Write down everything you remember first, then compare with the sheet.

Wall · Digital · Print

The most reliable code in the test — strong in all three subjects.

Tested on the French Revolution

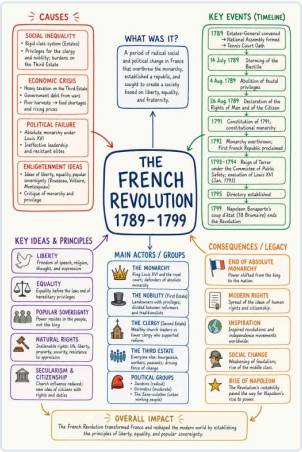

/mindmap

Branches out from the topic in the middle: causes, events, people, legacy.

MAKE IT ACTIVE

Draw your own mind map from memory, then compare.

Wall · Digital

Tested on the French Revolution

/conceptmap

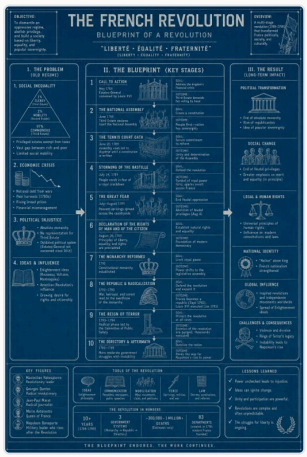

Boxes and arrows that show how the ideas connect.

MAKE IT ACTIVE

Find the error before you use it.

Wall · Digital · Spot the error

The clergy and the nobility have swapped places: the clergy was the First Estate. The photosynthesis version had a factual error too.

Tested on the French Revolution

/blueprint

The topic drawn as an architect's plan: problem, stages, result.

MAKE IT ACTIVE

Cover the middle column and rebuild the stages in order.

Wall

On the image-codes page /blueprint restyles a photo. With a topic it builds a plan instead.

Tested on the French Revolution

/visualvocab

Key terms as a picture glossary: one image and one sentence per term.

MAKE IT ACTIVE

Cover the sentences and explain each picture.

Wall · Digital

Tested on the French Revolution

/iconsummary

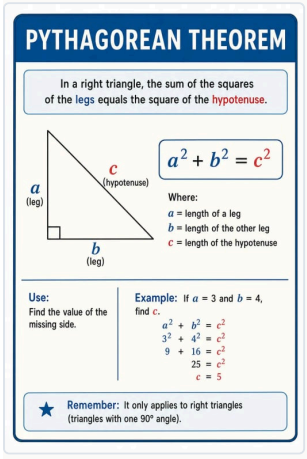

The main points, each carried by an icon.

MAKE IT ACTIVE

Cover the text and tell the story from the icons alone.

Digital

Close to /cheatsheet — pick one of the two.

Tested on the Pythagorean theorem

/formulacard

The formula, what each letter means and one worked example — nothing more.

MAKE IT ACTIVE

Make up a new example and solve it.

Wall · Digital

4 CODES

Follow the sequence

For anything that happens in order: events, steps, a method.

Tested on the French Revolution

/timeline

Dated events in order, each with a picture and a sentence.

MAKE IT ACTIVE

Cover the dates and put the events in order.

Wall · Digital

On photosynthesis it drew the history of the discovery rather than the steps of the process — a fair choice, but not the obvious one.

Tested on the French Revolution

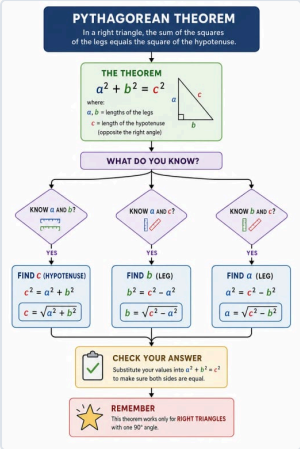

/storyboard

The topic as a sequence of illustrated frames.

MAKE IT ACTIVE

Cut the frames apart and lay them out in order.

Wall · Digital

Tested on the Pythagorean theorem

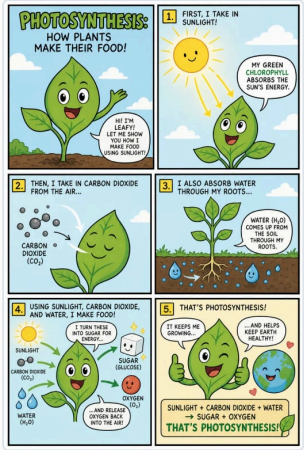

/flowchart

A method as decisions and steps. In maths: which side are you looking for?

MAKE IT ACTIVE
Solve a problem by following the chart, step by step.

Wall · Digital

In history it drew causes and phases as a flow instead.

Tested on photosynthesis

/comicstrip

The topic told as a comic, with characters who explain.

MAKE IT ACTIVE
Blank out the speech bubbles and write them yourself.

Digital · Print

A talking leaf for younger students. On the French Revolution it became a long history comic.

3 CODES

Remember and compare

Codes that sort out what is easy to mix up — and help the facts stick.

Tested on photosynthesis

/misconceptions

Common mistakes on the left, what is actually true on the right.

MAKE IT ACTIVE
Fold back the right column and explain why each statement is wrong.

Wall · Print

Tested on the French Revolution

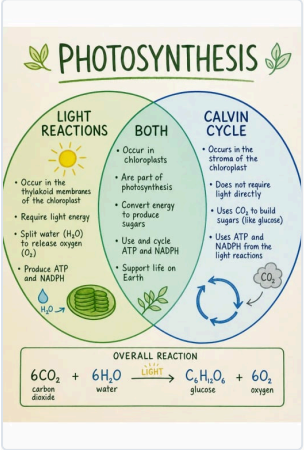

/mnemonicart

A memory aid drawn as a picture — here the acrostic LIBERTÉ.

MAKE IT ACTIVE
Memory aids help with facts and words, not with understanding. Use it for the list, then explain the links yourself.

Digital · Wall · Spot the error

The central figure is borrowed from Delacroix's Liberty Leading the People — painted in 1830, about a later revolution.

Tested on photosynthesis

/venndiagram

Two overlapping circles: what is unique to each, and what they share.

MAKE IT ACTIVE
Name the two things to compare in your prompt.

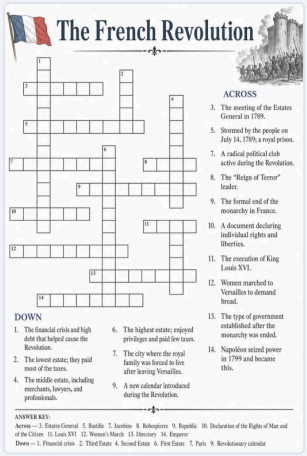

Print · Wall · Check the result · Spot the error

Needs two things to compare. Here it chose the light reactions and the Calvin cycle, but claims both produce sugar — only the Calvin cycle does. On the French Revolution it had nothing to compare and became decoration.

4 CODES

Tested — doesn't work (yet)

Four codes from the lists that failed. Shown so you don't have to find out in front of a class.

Tested on the French Revolution

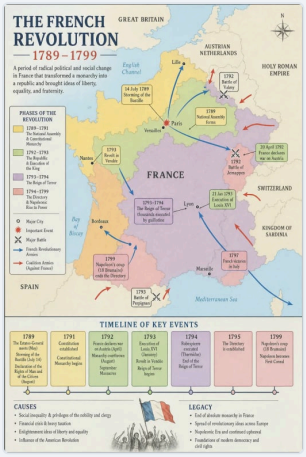

/crosswordit

Should give a crossword.

> ADD An empty crossword grid with numbered clues. Answer key in small print at the bottom.

Doesn't work yet

The grid does not fit the answers, clue numbers clash, and one clue calls merchants the Second Estate. Puzzles that must add up exactly are beyond the model.

Tested on the French Revolution

/mapit

Should give a map of the topic.

Doesn't work yet

Convincing at a glance, wrong in detail: the battle of Jemappes is placed inside France and the coup of 1799 in the south-west. A good image for spotting errors — not for learning geography.

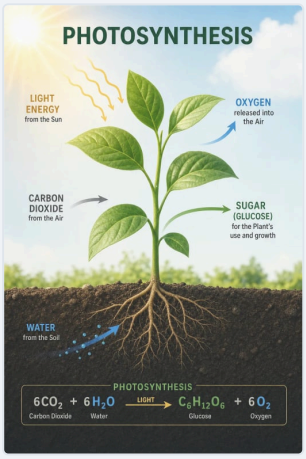

Tested on the French Revolution

/thenvsnow

Should compare then and now.

Doesn't work yet

Ignored. It became a general poster — again built around a painting from 1830.

Tested on photosynthesis

/analogy

Should explain the topic through a comparison from everyday life.

Doesn't work yet

Ignored. It drew an ordinary poster of a plant — no analogy anywhere.

ABOUT THIS DOCUMENT

Colophon

Title	Visual codes for studying
Author	Johan Lindström
Edition	First edition, October 2026

Usage and rights

Free to share with attribution under CC BY-NC-SA 4.0. Print it, pass it to colleagues, use it in your school. You may not sell it or rebrand it as your own.

On the codes themselves

The codes come from code lists circulating on social media. Everything else here is original: the testing, the selection, the split into practise and read, every description and every note.

How the images were made

Every image was made with GPT Image 2 (portrait, 1024 × 1536, high quality) from the prompt behind its card: the code, the topic, *Make it an image.* and — where a card has one — the sentence on its ADD line. 27 codes were tested on three subjects, about 60 images in all. Where a code needed an added sentence, it took up to three rounds to find one that worked; the sentence printed is the one behind the image shown. Nothing was retouched by hand, and the codes that failed are printed too.

A note on accuracy

These images are teaching aids, not references. Check every fact and work through every answer key before a sheet reaches students. Rules for AI in school differ between countries and change quickly: readers outside Sweden — and inside it — should check their own national rules and their school's guidelines.

KEEP GOING

The right tool at the right time.

A study code is only as good as what the student does with the result. Schools rarely need more AI tools — they need the judgment to choose the right one, and to notice what the student stops doing when they use it.

Every code online	Full-size images and a copy button for every prompt. choosewise.education/visual-codes/study
Visual codes for images and video	50 codes that turn a photo into a teaching visual, and 45 for video. choosewise.education/visual-codes
The WISE Framework for Education	A four-step decision model — Weigh, Inspect, Select, Evaluate — for choosing AI tools in school. Free to download at choosewise.education/wise
