The WISE Framework for Education

The right tool at the right time

WISE for Teachers

How to choose the right tool in the classroom.

W **Weigh the learning goal**

What should students learn? What prior knowledge do they have? Always start with pedagogy — never with the tool.

I **Inspect what the subject requires**

What does this particular subject and content call for? An essay in language arts has different tool needs than a problem-solving task in mathematics.

S **Select the right tool**

Choose the tool that best serves learning for the students you have: pen and paper, a physical book, a digital book, other digital tools, an AI tool, no tool at all, or something entirely different?

E **Evaluate the outcome**

Did it work well? Did students learn better with this tool than they would have with a different one? Adjust and run the cycle again.

> **One important exception**
>
> There is an exception where the teacher should choose a different tool than the one the WISE Framework recommends — and that is when the tool that leads to the best learning for students also leads to negative consequences. These consequences may affect individual students or the entire class. This is where the teacher's professional judgment comes in, and the teacher must weigh the pros and cons before making a well-founded decision.

WISE for School Leaders

How to steer your school's tool strategy as a principal or superintendent.

W **Weigh the objective**

What problem should this initiative solve? Start with the school's vision and the needs of students and teachers — not with the tech budget or the latest tool.

I **Investigate subjects and operations**

Which subjects and activities benefit from this initiative — and which don't? An investment that works in mathematics may not work in language arts. Conduct thorough needs assessments that lead to well-founded decisions!

S **Select with strategic intent**

Which tools should the school invest in — and which should it actively choose not to? Which of the tools currently available deliver the desired results and which don't?

E **Evaluate with data**

Set evaluation criteria before the initiative is implemented — not afterwards. Did student outcomes improve? Did teacher competence increase? Use data to evaluate and discontinue what doesn't work.

"More tools or wiser choices — which does your school need?"
